Correspondence e-mail: cora.macbeth@emory.edu

Received 21 June 2011; accepted 18 July 2011

Key indicators: single-crystal X-ray study;  $T = 173$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.035;  $wR$  factor = 0.106; data-to-parameter ratio = 14.7.

The title compound,  $\text{C}_8\text{H}_{17}\text{NO}$ , crystallizes with two independent molecules in the asymmetric unit. In the crystal, intermolecular  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonding is observed between neighboring molecules, forming continuous molecular chains along the  $c$ -axis direction.

## Related literature

For the synthesis of the title compound, see: De Kimpe *et al.* (1978); Christensen *et al.* (1989); Yasuhara *et al.* (2000); Li *et al.* (2003). For its use as a ligand in Zr and Ti complexes, see: Li *et al.* (2003). For background to the coordination modes of carboxamides, see: Lee & Schafer (2007).

## Experimental

## *N*-*tert*-Butyl-2-methylpropanamide

K. A. Kluge, D. Fridyland, C. E. MacBeth and K. I. Hardcastle

### Comment

Carboxamides can be deprotonated to form monoanionic amidate ligands. These species can coordinate to transition metal ions through a variety of different coordination modes, including monodentate and bidentate coordination modes, and therefore are coordinatively versatile ligands (Lee & Schafer, 2007). The ease of synthesis of carboxamides make them attractive ligands for a variety of transition metal mediated catalytic reactions, see: Li *et al.* (2003) and Lee & Schafer (2007). Although the synthesis of this compound has been previously described, its solid-state structure has not been reported. The two molecules (A and B) of *N*-*tert*-butyl-2-methylpropanamide (Fig. 1) are stabilized by intermolecular N—H···O hydrogen bonds (Table 1, Fig. 2).

### Experimental

The title molecule was synthesized using a modified literature procedure (Li *et al.*, 2003). Under a nitrogen atmosphere, a 100 ml round bottom flask was charged with 50 ml of dichloromethane, 4.31 ml (41.0 mmol) *tert*-butylamine, 8.55 ml (61.5 mmol) of triethylamine and a stir bar. The solution was cooled to 0 °C and 5.20 ml (49.2 mmol) of isobutyryl chloride was added dropwise. The solution was slowly warmed to room temperature overnight. The resulting pink solution was extracted three times with 50 ml of 0.10 M HCl. The organic layer was dried over anhydrous magnesium sulfate, filtered, and concentrated to dryness to yield the desired product in 60% yield. X-ray quality crystals were obtained by slowly evaporating a chloroform solution of the product. The spectroscopic data (NMR, IR, and ESI-MS) match well with the reported values (Li *et al.*, 2003).

### Refinement

The structures were solved using Direct Methods and difference Fourier techniques (*SHELXTL*, V6.12) (Sheldrick, 2008). Hydrogen atoms were added with the HFIX command. These were included in the final cycles of least squares refinement, with isotropic  $U^{ij}$ s that were determined by the riding model. All non-hydrogen atoms in the main residues were refined anisotropically, but residual solvent molecules in the unit cells were refined isotropically. Structure solution, refinement, and generation of publication materials were performed by using *SHELX*, V6.12 software.

### Figures

Fig. 1. Molecule A and Molecule B of *N*-*tert*-butyl-2-methylpropanamide. H atoms except H1A and H2A were omitted for clarity. Thermal ellipsoids are drawn at 50% probability.

Fig. 2. Molecular packing and hydrogen bonding (dashed lines) network of *N-tert-butyl-2-methylpropanamide* viewed down the *b* axis.

## *N-tert-butyl-2-methylpropanamide*

### Crystal data

$C_8H_{17}NO$	$F(000) = 320$
$M_r = 143.23$	$D_x = 1.008 \text{ Mg m}^{-3}$
Monoclinic, $P2_1$	Melting point: 393 K
Hall symbol: P 2yb	Cu $K\alpha$ radiation, $\lambda = 1.54178 \text{ \AA}$
$a = 9.0378 (6) \text{ \AA}$	Cell parameters from 4549 reflections
$b = 11.3939 (8) \text{ \AA}$	$\theta = 4.8\text{--}69.1^\circ$
$c = 9.5390 (6) \text{ \AA}$	$\mu = 0.51 \text{ mm}^{-1}$
$\beta = 106.133 (3)^\circ$	$T = 173 \text{ K}$
$V = 943.60 (11) \text{ \AA}^3$	Block, colourless
$Z = 4$	$0.31 \times 0.20 \times 0.12 \text{ mm}$

### Data collection

Bruker APEXII CCD diffractometer	2662 independent reflections
Radiation source: fine-focus sealed tube graphite	2624 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.014$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2008)	$\theta_{\text{max}} = 69.1^\circ$ , $\theta_{\text{min}} = 4.8^\circ$
$T_{\text{min}} = 0.858$ , $T_{\text{max}} = 0.941$	$h = -10 \rightarrow 10$
6358 measured reflections	$k = -13 \rightarrow 12$
	$l = -11 \rightarrow 11$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.035$	H-atom parameters constrained
$wR(F^2) = 0.106$	$w = 1/[\sigma^2(F_o^2) + (0.088P)^2 + 0.0504P]$
$S = 1.00$	where $P = (F_o^2 + 2F_c^2)/3$
2662 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
181 parameters	$\Delta\rho_{\text{max}} = 0.19 \text{ e \AA}^{-3}$
1 restraint	$\Delta\rho_{\text{min}} = -0.16 \text{ e \AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 812 Friedel pairs
	Flack parameter: 0.3 (2)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.
