Abstract

Using a rhodium(II)-catalyzed cyclization/cycloaddition sequence as the key reaction step, the icetexane core of komaroviquinone was constructed by an intramolecular dipolar-cycloaddition of a carbonyl ylide dipole across a tethered π-bond. The ylide was arrived at by cyclization of a rhodium carbenoid intermediate onto a proximal ester group. Efforts towards the preparation of the required precursor for elaboration to the natural product are discussed.

Keywords
diterpene; icetexane; komaroviquinone; diazo carbonyl; rhodium(II); catalyst; carbonyl ylide; intramolecular; dipolar-cycloaddition

1. Introduction

Dried whole plants of a perennial semishrub that is referred to as ‘buzbosh’ (Dracocephalum komarovi) in Uzbekistan were extracted and fractionated to give several icetexane diterpenes whose structures were elucidated by extensive analysis of their NMR data.1,2 The major fraction isolated from the plant was assigned structure 1 and was named komaroviquinone. This compound showed strong in vitro trypanocidal activity against epimastigotes of Trypanosoma cruzi, the causative agent of Chagas’ disease in Central and South America.3 In addition to compound 1, a minor diterpene 2 was also isolated from the same plant which possesses a novel spiro-octahydroindene skeleton and was named komarovispirone (2).4 Biogenetically, komarovispirone (2) may be derived from komaroviquinone (1) through a novel ring-contraction sequence as outlined in Scheme 1. The stereochemistry of 2 was tentatively assigned as indicated in the scheme.

The total syntheses of several related diterpenes which incorporate a functionalized 6-7-6 fused tricyclic framework have appeared in the literature5–7 and involve generation of the basic skeleton mainly through acid-catalyzed cyclialkylation reactions.8 More recently, the first total synthesis of (±)-komaroviquinone (1) was reported by Banerjee and coworkers in 2005.9

Construction of the critical trans-10-hydroxy-1,1-dimethyloctahydrodibenzo[a,d]cyclohepten-7-one core was achieved by employing an intramolecular Heck reaction for the
crucial carbon-carbon bond forming step. Thus, cyclization of the olefinic intermediate with Pd(OAc)$_2$, K$_2$CO$_3$ and PPh$_3$ in acetonitrile under reflux was followed by oxidation of the methylene group to produce ketone, which was found to be in equilibrium with the hemiketal in solution. Further oxidation of the equilibrating mixture with silver oxide in dilute HNO$_3$ afforded (±)-komaroviquinone (I) as the major product in 68% yield for this last step (Scheme 2).

Based on prior work in our laboratory using the intramolecular dipolar-cycloaddition reaction of carbonyl ylides for the synthesis of various natural products, we felt that the Rh(II)-catalyzed reaction of a diazo-dione precursor (i.e., 7) might allow for a facile entry to the ictexane core of komaroviquinone (I). The eventual formation of the oxa-tricyclo[6.3.1.0$^{0,0}$]dodecane skeleton of I was envisioned to come about from cyclization of the rhodium carbenoid intermediate 8 with the adjacent carboxymethoxy group. The ensuing dipole 9 was expected to undergo an intramolecular [3+2]-cycloaddition across the tethered π-bond. The resulting cycloadduct 10 would then be converted to (±)-komaroviquinone in several steps via sequential reduction of the keto groups, oxidation to the benzoquinone core and acid hydrolysis of the ketal moiety (Scheme 3).

2. Results and Discussion

1,3-Dicarbonyl compounds represent a basic building block in organic chemistry and consequently many procedures have been developed for their synthesis. Among these methods, the condensation of ethyl diazoacetate with aldehydes employing a variety of Lewis and Bronsted acids as catalysts represents a facile and efficient way to prepare 1,3-diones. Another approach involves the condensation of an aldehyde with an α-diazo ketone and the resulting aldol product is then subjected to a metal-catalyzed decomposition. In order to test the feasibility of the retrosynthetic strategy outlined in Scheme 3, our initial efforts were focused on several model substrates. According to our design, we hoped to employ a tandem cyclization/cycloaddition reaction of a rhodium carbenoid intermediate to rapidly generate the 9,10-benzo-12-oxa-tricyclo[6.3.1.0$^{0,0}$]dodecane-dione skeleton from a relatively simple precursor (i.e., 13).

Our synthesis of the key diazo-dione 13 commenced with o-carboxymethoxy diazoketone 11 which is readily available in high yield from phthalic acid monomethyl ester. We anticipated that under suitable reaction conditions, 11 would react with hex-5-enal to give diketone 12 following a protocol developed by Holmqvist and Roskamp for β-keto esters. These authors have found that aldehydes can be converted into β-keto esters by the addition of ethyl diazoacetate in the presence of tin(II) chloride. In our hands, a modest (but unoptimized) yield of 12 (ca 40%) was obtained from the reaction of 11 with hex-5-enal. A subsequent Regitz diazo transfer reaction using nosyl azide and Et$_3$N furnished diazo-dione 13 in 98% yield. Treating a sample of 13 with Rh$_2$(OAc)$_4$ in benzene at 80 °C afforded cycloadduct 16 in 75% yield (Scheme 4). Interestingly, when the Rh(II)-catalyzed reaction was carried out at room temperature, the major product isolated corresponded to epoxy-indanone 15 (71%) with only a small amount (<10%) of cycloadduct 16 being formed. Heating a sample of 15 at 80 °C in benzene gave 16 in 78% isolated yield. This reaction presumably occurs via thermal C-C bond cleavage of the epoxide ring to generate dipole 14 which undergoes a subsequent intramolecular [3+2]-cycloaddition to give 16. Most noteworthy, when a sample of the methoxy substituted cycloadduct 16 was treated with aqueous acid it was smoothly converted into the corresponding hemiketal 17. We assume that the hydrolytic conversion of 16 to 17 occurs by oxabicyclic ring opening under the acidic conditions to produce a hydroxy-tricarbonyl as a transient species which subsequently cyclizes to hemiketal 17.
Many studies support the intermediacy of carbonyl ylides in reactions involving the interaction of a metallocarbenoid with a carbonyl oxygen.\textsuperscript{22} The great majority of literature reports on carbonyl ylides are dominated by 1,3-dipolar cycloaddition reactions rather than cyclization of the dipole to produce the oxirane ring system.\textsuperscript{11–14} Huisgen was the first to report the formation of an epoxide from the reaction of dimethyl diazomalonate with benzaldehyde, but only in 7\% yield when the reaction was carried out at 125 °C in the presence of 1 mol\% of Cu (acac)\textsubscript{2}.\textsuperscript{23} More recently, the Doyle\textsuperscript{24} and Davies\textsuperscript{25} groups have reported on stereospecific epoxide formation by Rh\textsubscript{2}(OAc)\textsubscript{4} catalyzed reactions of aryl, heteroaryl, and vinyl diazoacetates with α,β-unsaturated aldehydes or ketones. Later, a similar epoxidation process was used to prepare spirowindoioxiranes with cyclic diazoamides by the Mathusamy group.\textsuperscript{26} When dimethyl diazomalonate was used as the carbenoid source, a competition between dioxolane and epoxide formation was noted. Doyle was able to direct the decomposition of the diazomalonate system to produce either epoxide or dioxolane by influencing the stability of the intermediate carbonyl ylide dipole.\textsuperscript{27} When the electron rich p-anisaldehyde was used as the trapping reagent, only epoxide formation was observed. Stabilization of the intermediate ylide was suggested to account for its diminished reactivity toward cycloaddition with a second molecule of the added aldehyde. The fact that we were able to isolate epoxide \textsuperscript{15} in 71\% yield from the cyclization of dipole \textsuperscript{14} is perfectly consistent with the Doyle observations (Scheme 4). Thus, stabilization of the positive center of the dipole by interaction with the adjacent methoxy group diminishes the rate of the dipolar cycloaddition reaction and promotes cyclization of the ylide to the epoxide ring.

The Rh(II)-catalyzed reaction of the related dimethyl substituted diazo ester \textsuperscript{25} was also studied since this system contained the required substituent groups needed for the eventual synthesis of komaroviquinone (1). The rate of an intramolecular reaction is often increased when alkyl groups are placed on a chain between the two reacting centers.\textsuperscript{28} This is known as the gem-dialkyl effect and is often exploited to promote difficult cyclization reactions.\textsuperscript{29}

The required side chain for the Rh(II)-catalyzed reaction was prepared using standard chemistry starting from ethyl 2,2-dimethylpent-4-enoate \textsuperscript{18} (Scheme 5). Hydroboration-oxidation followed by protection of the resulting hydroxyl group gave ester \textsuperscript{20}. Adjustment of the oxidation state was followed by Wittig methylation in 80\% yield. The hydroxyl group was unmasked and oxidized to give aldehyde \textsuperscript{23} which was coupled with α-diazoketone \textsuperscript{11} and further elaborated to diazo dione \textsuperscript{25} as before to give the key substrate needed for the cyclization/cycloaddition sequence. Indeed, the reaction of diazo dione \textsuperscript{25} with a Rh(II) catalyst gave cycloadduct \textsuperscript{26} in 92\% yield, Scheme 6. Most importantly, when \textsuperscript{26} was treated with aqueous acid it was readily converted to \textsuperscript{27} in essentially quantitative yield. The conversion of \textsuperscript{25} to \textsuperscript{27} via this method suggests that a similar approach could be used in our planned synthesis of komaroviquinone (1).

Accordingly, we set out to prepare the diazo dicarbonyl precursor \textsuperscript{7} which is essential for our planned synthetic route. After the cycloaddition chemistry, oxidation of the aromatic portion would be expected to provide the para-benoquinone moiety found in the natural product. Thus, the challenge became the preparation of a hexa-substituted aromatic carboxylic acid (i.e. \textsuperscript{30}) which could be coupled via α-diazo ketone \textsuperscript{29} to a suitable olefinic tether to give the necessary diazo dicarbonyl precursor \textsuperscript{7} (Scheme 7).

Our approach towards carboxylic acid \textsuperscript{30} initially centered on the thermal rearrangement of cyclobutenones.\textsuperscript{30} Moore and co-workers have shown this to be an expedient route for the preparation of phenols.\textsuperscript{31} Starting from squaric acid (31), methylation with diazomethane gave dimethyl squarate (Scheme 8).\textsuperscript{32} Treatment with \textit{iso}-propyl magnesium bromide at –78 °C followed by hydrolysis produced cyclobutenedione \textsuperscript{32} in 89\% yield. The thermal rearrangement precursor was formed by addition of 2-lithiopropene to a solution of \textsuperscript{32} in THF.
at −78 °C followed by trapping with methyl triflate. The mixture was then heated at reflux in hexane to give phenol 33 as the only isolable product in 45% yield. The addition of the organo lithium reagent to dione 32 was completely regioselective and resulted in the formation of only one of the two possible regioisomeric phenols. The identification of phenol 33 was confirmed by NMR spectroscopy studies and is consistent with reports made elsewhere.31

Prior to elaboration of the 2-\(H\) position of phenol 33, protection of the phenolic hydroxy group was carried out using sodium hydride/methyl triflate in 90% yield. Our initial attempts to introduce functionality into this position employing lithiation chemistry were unsuccessful. \textit{ortho}-Lithiation under a range of conditions (\(n\)-BuLi, \(n\)-BuLi/TMEDA, \(s\)-BuLi/TMEDA) at a variety of temperatures followed by quenching with methyl chloroformate resulted only in recovered starting material. We next turned our attention to a mild bromination protocol developed by Kulkarni and co-workers.33 They reported on the use of KBr/oxone® as a facile method for the bromination of a variety of aromatic compounds. In our hands using methanol as the solvent, the brominated derivative 35 was obtained in 67% yield. Both lithium-halogen exchange and carbonyl insertion chemistry were examined without success. We suspect that steric crowding around the carbon atom bearing the bromo atom is responsible for the difficulty in converting the aryl bromide into the corresponding carboxamidoxy group.

Despite the congestion about the aromatic scaffold, we decided to develop another approach towards the synthesis of carboxylic acid 30. Introduction of a primary alcohol in place of the methyl group should result in a better directing group for the subsequent \textit{ortho}-lithiation reaction since an electron lone pair on the oxygen atom would coordinate to the lithium ion thereby enhancing the stability of the complex. The cyclobutanone/thermolysis chemistry still appeared worth carrying out since the use of lithiopropynes had been reported earlier.31 With this in mind, the tetrahydropyranyl protected propargyl alcohol 37 was treated with \(n\)-BuLi followed by reaction with cyclobutenedione 32 in a manner analogous to that described above, Scheme 9. Disappointingly, the expected phenol 39 could not be observed in the crude reaction mixture after heating in toluene. Therefore, we embarked on an alternative strategy for the synthesis of the related alcohol 44 starting from 1,2,4-trimethoxybenzene (see Scheme 10). Treatment of this compound with \(n\)-BuLi at −78 °C resulted in the selective lithiation at the 3-position of the aromatic ring by virtue of lithiate coordination with the adjacent methoxy groups. Quenching with methyl chloroformate followed by methyl Grignard addition afforded tertiary alcohol 41 which was subsequently dehydrated and hydrogenated in a one pot procedure to give 42.34 This compound was then subjected to a regiospecific bromination by following a procedure described by Carreño35 which resulted in the formation of compound 43 in excellent yield. Next, lithium-halogen exchange followed by reaction with \(N, N\)'-dimethyl formamide provided the expected aldehyde which was readily reduced with sodium borohydride to furnish alcohol 44 in 78% over the final two steps.

At this point we anticipated that lithiation at the remaining aromatic ring position would provide a nucleophilic site which could be subsequently treated with a suitable electrophile to supply ester 46 (see Scheme 11). Unfortunately, this could not be borne out in practice as the steric congestion around the local environment proved prohibitory.

Consequently, we turned our attention to still another approach designed to alleviate the steric crowding by preparing a penta-substituted aromatic ring with the expectation that the final substituent could be introduced by an oxidation reaction to give the desired \textit{para}-quinone (see Scheme 12).

Starting from 2,3-dimethoxybenzoic acid (49), methyl esterification followed by Grignard addition of methyl magnesium bromide delivered alcohol 50 in 89% for the two step sequence (Scheme 13). Once again, the dehydration-hydrogenation protocol proceeded uneventfully to
give isopropyl veratrole 51 in 65% yield. This compound was subsequently treated with n-BuLi followed by reaction with N,N'-dimethylformamide to give aldehyde 52 in 82% yield. 36,37

Further functionalization of the aromatic framework was not possible using either Comins'38 lithiation chemistry or by electrophilic substitution chemistry. Therefore, the aldehydic carbonyl group was reduced with sodium borohydride and protected as its MOM ether derivative 53. Lithiation of 53 returned only starting material and so instead, 53 was exposed to N-bromosuccinimide which successfully delivered the bromo compound 54, albeit as a mixture of regioisomers and with the desired aryl bromide 54 being formed in only 24% yield. The two regioisomeric bromides could be distinguished from the respective nOe’s of the aromatic proton. A minor improvement in the regiomer ratio could be obtained by changing the reaction conditions, but at the expense of a lower overall reaction yield. The rather low yield of the desired bromide led to the abandonment of this particular route. Further approaches toward the necessary aromatic framework are currently under investigation.

In conclusion, the Rh(II)-catalyzed intramolecular dipolar cycloaddition described herein allows for a facile access to the icetexane core of komaroviquinone. Completion of the synthesis of the natural product requires the preparation of a highly substituted aromatic system which has thus far proved elusive. Efforts are currently underway to address this issue in order to enable the completion of the synthesis.

3. Experimental

3.1 General

Melting points are uncorrected. Mass spectra were determined at an ionizing voltage of 70 eV. Unless otherwise noted, all reactions were performed in flame-dried glassware under an atmosphere of dry argon. All solids were recrystallized from ethyl acetate/hexane for analytical data.

-o-Methoxy carbonyl-α-diazoacetophenone (11)—To a 5.0 g (28 mmol) sample of phthalic acid monomethyl ester was added 24 mL (0.28 mol) of thionyl chloride at rt. The mixture was stirred at 25 °C for 3 h and then the excess thionyl chloride was removed under reduced pressure. The crude residue was dissolved in 200 mL of Et2O and an ethereal solution of diazomethane, prepared by the addition of 32 g (0.15 mol) of diazald (N-methyl-N-nitroso-p-toluenesulfonamide) in 60 mL of Et2O to 7.7 g (0.14 mol) of potassium hydroxide in 12 mL of water and 37 mL of ethanol, was added to the above acid chloride solution at 0 °C. After the addition was complete, the reaction mixture was allowed to warm to room temperature. Excess silica gel was added, the mixture was stirred for 5 min, filtered, and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 40% EtOAc/hexane mixture as the eluent to provide 5.1 g (99%) of the titled compound as a yellow solid: mp 61–62 °C (lit39 mp 62–63 °C); IR (neat) 3094, 2100, 1726, 1268, 1352 cm⁻¹; 1H-NMR (400 MHz, CDCl₃) δ 3.88 (s, 3H), 5.58 (brs, 1H), 7.39 (dd, 1H, J = 7.2 and 2.0 Hz), 7.44–7.52 (m, 2H) and 7.80 (brs, 1H); 13C-NMR (100 MHz, CDCl₃) δ 52.5, 56.1, 126.8, 129.8, 130.3, 130.8, 131.5, 139.6, 167.4 and 188.7.

Methyl 2-(3-oxo-oct-7-enoyl)benzoate (12)—To a solution containing 0.09 g (0.88 mmol) sample of hex-5-enal and 0.01 g of SnCl₂ (0.1 mmol) in 1 mL of CH₂Cl₂ was added 0.15 g (0.74 mmol) of the above diazo ketone 11 in 2 mL of CH₂Cl₂. The mixture was stirred at room temperature for 1 h, diluted with CH₂Cl₂ and washed with water. The organic phase was dried over Na₂SO₄ and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 30% EtOAc/hexane mixture as the eluent to provide 0.04 g (41%) of the titled compound as a yellow oil which exists.
predominantly in the enol form: IR (neat) 1734, 1727, 1545, 1396, 1292 and 1063 cm\(^{-1}\); \(^1\)H-NMR (400 MHz, CDCl\(_3\)) \(\delta\) 1.81–1.90 (m, 2H), 2.15 (q, 2H, \(J = 6.7\) Hz), 2.62 (q, 2H, \(J = 7.6\) Hz), 3.87 (s, 3H), 5.00–5.08 (m, 2H), 5.70–5.82 (m, 1H), 6.28 (s, 1H), 7.57–7.66 (m, 3H) and 7.82–7.86 (m, 1H), and 15.6 (bs, 1H); \(^{13}\)C-NMR (100 MHz, CDCl\(_3\)) \(\delta\) 24.8, 32.9, 37.2, 53.0, 100.2, 116.3, 129.0, 130.4, 131.4, 132.2, 132.8, 133.3, 136.9, 167.2, 186.4 and 196.8; HRMS Calcd for [(C\(_{10}\)H\(_{18}\)O\(_4\) + H\(^+\)]: 275.1278. Found: 275.1274.

Methyl 2-(2-diazo-3-oxo-oct-7-enoyl)benzoate (13)—To a solution containing 0.09 g (0.33 mmol) of the above 1,3-dione 12 in 3.0 mL of CH\(_2\)CN was added 0.14 mL (0.98 mmol) of Et\(_3\)N and 0.07 g (0.39 mmol) of p-nitrobenzenesulfonyl azide\(^40\) at room temperature. The mixture was stirred at rt for 1 h. The solvent was removed under reduced pressure and the crude residue was purified by flash silica gel column chromatography using a 10\% EtOAc/hexane mixture as the eluent to provide 0.1 g (98\%) of the titled compound as a pale yellow oil: IR (neat) 2120, 1721, 1656 and 1195 cm\(^{-1}\); \(^1\)H-NMR (400 MHz, CDCl\(_3\)) \(\delta\) 1.71–1.77 (m, 2H), 2.09 (q, 2H, \(J = 6.7\) Hz), 2.83 (brs, 2H), 3.87 (s, 3H), 4.95 (d, 1H, \(J = 10.5\) Hz), 5.00 (d, 1H, \(J = 17.1\) Hz), 5.71–5.81 (m, 1H), 7.34 (d, 1H, \(J = 7.6\) Hz), 7.54 (td, 1H, \(J = 7.6\) and 1.0 Hz), 7.62 (td, 1H, \(J = 7.6\) and 1.0 Hz) and 8.03 (d, 1H, \(J = 7.6\) Hz); \(^{13}\)C-NMR (100 MHz, CDCl\(_3\)) \(\delta\) 23.1, 33.0, 40.2, 2.84–2.95 (m, 1H), 3.50 (s, 3H), 7.42–7.50 (m, 2H), 7.63 (td, 1H, \(J = 7.3\) and 1.3 Hz) and 7.99 (dd, 1H, \(J = 8.3\) and 1.3 Hz); \(^{13}\)C-NMR (100 MHz, CDCl\(_3\)) \(\delta\) 21.7, 28.4, 37.2, 41.9, 42.0, 52.8, 85.8, 115.2, 126.3, 127.6, 130.1, 130.6, 132.9, 137.6, 140.5, 165.8, 186.4 and 191.8.

8-Methoxy-12-oxatricyclo[6.3.1.0.\(^4\)16\(^8\)]octahydrodibenzofuran-4,11-dione (16)—To a solution containing 0.13 g (0.43 mmol) of the above diazo-dione in 5 mL of benzene was added 0.01 g (0.02 mmol) of Rh\(_2\)(OAc)\(_4\) at room temperature. The mixture was heated for 30 min at 80 °C, cooled to room temperature and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 50\% EtOAc/hexane mixture as the eluent to provide 0.03 g (75\%) of the titled compound as a pale yellow solid: mp 165–166 °C; IR (neat) 3025, 2910, 1726, 1693, 1600, 1305 and 1281 cm\(^{-1}\); \(^1\)H-NMR (400 MHz, CDCl\(_3\)) \(\delta\) 1.39–1.52 (m, 1H), 1.92–2.12 (m, 4H), 2.32 (dd, 1H, \(J = 12.4\) and 5.6 Hz), 2.51–2.63 (m, 2H), 2.84–2.95 (m, 1H), 3.50 (s, 3H), 7.42–7.50 (m, 2H), 7.63 (td, 1H, \(J = 7.3\) and 1.3 Hz) and 7.99 (dd, 1H, \(J = 8.3\) and 1.3 Hz); \(^{13}\)C-NMR (100 MHz, CDCl\(_3\)) \(\delta\) 23.0, 33.0, 40.3, 51.9, 90.3, 99.5, 115.0, 125.6, 127.2, 129.5, 130.1, 130.6, 132.9, 137.6, 140.5, 165.8, 186.4 and 193.0.

6a-Hex-5-enoyl-1a-methoxy-1a,6a-dihydro-1-oxa-cyclopropa[a]inden-6-one (15)—To a solution containing 0.1 g (0.33 mmol) of the above diazo-dione in 3 mL of benzene was added 0.01 g (0.02 mmol) of Rh\(_2\)(OAc)\(_4\) at room temperature. The mixture was stirred at room temperature for 30 min, the solvent was removed under reduced pressure and the crude residue was purified by flash silica gel column chromatography to provide 0.054 g (71\%) of the titled compound as a pale yellow solid, mp 113–115 °C; IR (neat) 1737, 1724, 1541, 1290 and 1061 cm\(^{-1}\); \(^1\)H-NMR (400 MHz, CDCl\(_3\)) \(\delta\) 1.67–1.87 (m, 2H), 2.05–2.20 (m, 2H), 2.80–2.99 (m, 2H), 3.42 (s, 3H), 4.94–5.08 (m, 2H), 5.76–5.88 (m, 1H), 7.28 (td, 1H, \(J = 7.9\) and 1.3 Hz), 7.41 (ddd, 2H, \(J = 15.9, 7.9\) and 1.0 Hz) and 7.58 (td, 1H, \(J = 7.9\) and 1.3 Hz); \(^{13}\)C-NMR (100 MHz, CDCl\(_3\)) \(\delta\) 23.0, 33.0, 40.3, 51.9, 90.3, 99.5, 115.0, 125.6, 127.2, 129.5, 130.1, 134.7, 137.4, 138.3, 187.0 and 197.8; Analy. Calcld. for C\(_{16}\)H\(_{16}\)O\(_4\); C, 70.56; H, 5.93. Found: C, 70.13; H, 5.74.

In addition, 0.009 g (10\%) of cycloadduct 15 in benzene at 100 °C for 2 h afforded cycloadduct 16 in 78\% yield.

8-Hydroxy-12-oxatricyclo[6.3.1.0.\(^4\)16\(^8\)]octahydrodibenzofuran-4,11-dione (17)—To a solution containing 0.1 g of cycloadduct 16 in a 1:2:1 mixture of THF/MeOH/H\(_2\)O (2 mL) was added 0.5 mL of conc. HCl. The mixture was heated at reflux for 6 h, cooled to rt and

extracted with EtOAc. The combined organic layer was dried over MgSO₄, the solvent was removed under reduced pressure and the crude mixture was purified by flash silica gel column chromatography using a 50% EtOAc/hexane mixture as the eluent to provide 0.08 g (84%) of the titled compound as a yellow solid: mp 156–158 °C; IR (KBr) 3425, 2939, 1721, 1692 and 1289 cm⁻¹. ¹H-NMR (400 MHz, CDCl₃) δ 1.32 (qd, 1H, J = 12.7 and 4.8 Hz), 1.86–2.06 (m, 3H), 1.96 (dd, 1H, J = 12.0 and 6.7 Hz), 2.32 (dd, 1H, J = 12.0 and 8.6 Hz), 2.38–2.47 (m, 1H), 2.53 (ddd, 1H, J = 16.8, 9.5 and 6.0 Hz), 2.85 (ddd, 1H, J = 16.8, 11.1 and 4.8 Hz), 5.79 (s, 1H), 7.28 (td, 1H, J = 7.6 and 1.0 Hz) and 7.43–7.55 (m, 3H); ¹³C-NMR (100 MHz, CDCl₃) δ 21.8, 28.1, 36.7, 41.9, 43.2, 90.6, 103.6, 123.1, 127.1, 127.5, 128.4, 134.8, 146.7, 192.6 and 207.2; Anal. Calcd. for C₁₅H₁₄O₆: C, 69.74; H, 5.47. Found: C, 69.70; H, 5.34.

**Ethyl 5-hydroxy-2,2-dimethylpentanoate (19)**—To a stirred solution of 24 mL (12.0 mmol) of 9-BBN (0.5 M in THF) was added a solution of 2.0 g (12.0 mmol) of 2,2-dimethylpent-4-enoic acid ethyl ester in 6 mL of THF at room temperature. The mixture was heated at 50 °C for 1 h, cooled to 0 °C and 8 mL of ethanol, 2.4 mL of 6 M aqueous NaOH solution, and 4.8 mL of pent-4-enoic acid ethyl ester in 6 mL of THF at rt. After stirring for 2 h, the reaction was quenched by the slow addition of 30 mL of H₂O. The aqueous layer was extracted with EtOAc. The combined organic layer was dried over MgSO₄ and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 8% EtOAc/hexane mixture as the eluent to provide 1.2 g (55%) of the titled compound as a clear oil: IR (neat) 2960, 2925, 1726, 1701, 1470 and 1255 cm⁻¹. ¹H-NMR (400 MHz, CDCl₃) δ 1.15 (s, 6H), 1.22 (t, 2H, J = 6.0 Hz) and 4.15 (q, 2H, J = 7.2 Hz); ¹³C-NMR (100 MHz, CDCl₃) δ 13.9, 24.8, 27.9, 36.4, 41.6, 60.1, 62.4 and 177.9.  

**Ethyl 5-(tert-butyldimethylsilyloxy)-2,2-dimethylpentanoate (20)**—To a solution containing 0.75 g (4.0 mmol) of the above alcohol 19 in 2 mL of DMF was added 0.77 g (10.7 mmol) of imidazole and a crystal of 4-dimethylaminopyridine. The mixture was cooled to 0 °C for 15 min and then 0.77 g (5.0 mmol) of tert-butyldimethylsilyl chloride was added in one portion. The reaction was stirred for 2 h, quenched with H₂O and extracted with EtO. The combined organic layer was dried over MgSO₄ and the crude residue was purified by flash silica gel column chromatography using a 10% EtOAc/hexane mixture as the eluent to provide 1.0 g (95%) of the titled compound as a clear oil: IR (neat) 2650, 2925, 2889, 2848 and 1726 cm⁻¹; ¹H-NMR (400 MHz, CDCl₃) δ 0.05 (s, 6H), 0.84 (s, 9H), 1.12 (s, 6H), 1.20 (t, 3H, J = 7.4 Hz), 1.40–1.47 (m, 2H), 1.49–1.54 (m, 2H), 3.54 (t, 2H, J = 6.2 Hz) and 4.08 (q, 2H, J = 7.4 Hz); ¹³C-NMR (100 MHz, CDCl₃) δ −5.3, 14.2, 18.3, 25.1, 25.9, 28.4, 36.8, 41.8, 60.2, 63.4 and 177.9.  

**5-(tert-Butyldimethylsilyloxy)-2,2-dimethylpentanal (21)**—To a suspension of 0.13 g (3.0 mmol) of lithium aluminum hydride in 25 mL of Et₂O at 0 °C was added 0.99 g (3.0 mmol) of the above ester 20 in 10 mL of Et₂O. After stirring for 30 min at 0 °C, the reaction was quenched by the slow addition of 30 mL of H₂O. The aqueous layer was extracted with Et₂O, the solvent was dried and then removed under reduced pressure and the crude alcohol was taken up in 15 mL of CH₂Cl₂. This solution was added to a stirred solution of 1.1 g (4.5 mmol) of pyridinium chlorochromate in 10 mL of CH₂Cl₂ at room temperature. The mixture was stirred overnight, filtered and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 10% EtOAc/hexane mixture as the eluent to provide 0.59 g (70%) of the titled compound as a clear oil: IR (neat) 2960, 2925, 1726, 1701, 1470 and 1255 cm⁻¹; ¹H-NMR (400 MHz, CDCl₃) δ 0.04 (s, 6H), 0.85 (s, 9H), 1.15 (s, 6H), 1.35–1.50 (m, 4H), 3.60 (t, 2H, J = 6.0 Hz) and 9.40 (s, 1H); ¹³C-NMR (100 MHz, CDCl₃) δ −5.4, 18.3, 21.2, 25.9, 27.6, 33.3, 45.4, 63.1 and 206.2.
**tert-Butyl-4,4-dimethylhex-5-enyloxydimethylsilane (22)**—To a stirred solution of 0.48 g (1.2 mmol) of methyltriphenylphosphonium iodide in 5 mL of THF at 0 °C was slowly added 0.6 mL (1.2 mmol) of n-ButLi (2.1 M in THF). After stirring for 30 min, the solution was warmed to rt and was stirred for an additional 1 h. The mixture was then cooled to 0 °C and a solution of 0.29 g (1.1 mmol) of the above aldehyde 23 in 2 mL of THF was added dropwise and the mixture was allowed to warm to rt and was stirred overnight. The reaction mixture was quenched with H2O and extracted with Et2O. The combined organic layer was dried over MgSO4 and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 6% EtOAc/hexane mixture as the eluent to provide 0.19 g (80%) of the titled compound as a clear oil: IR (neat) 3084, 2955, 2852, 2807, 2709, 1726 and 1639 cm−1; 1H-NMR (400 MHz, CDCl3) δ 0.04 (s, 6H), 0.96 (s, 6H), 1.23–1.29 (m, 2H), 1.40–1.48 (m, 2H), 3.47 (t, 2H, J = 10.8 Hz), 4.92 (q, 1H, J = 1.2 Hz) and 5.76 (dd, 1H, J = 17.6 and 10.4 Hz); 13C-NMR (100 MHz, CDCl3) δ −5.3, 18.3, 26.0, 26.7, 31.1, 36.9, 110.3 and 148.4.

**4,4-Dimethylhex-5-enal (23)**—To a solution containing 0.45 g (1.9 mmol) of the above alkene 22 in 8 mL of THF was added 2.3 mL (2.3 mmol) of tetra-butyl ammonium fluoride (1.0 M in THF) at 0 °C. The reaction mixture was stirred for 2 h after which time a 1:1-mixture of H2O and Et2O was added to the solution. The aqueous layer was extracted with Et2O and the combined organic layer was dried over MgSO4. The solvent was removed under reduced pressure and the crude alcohol was redissolved in 3 mL of CH2Cl2. The mixture was added to a stirred solution of 0.6 g (2.7 mmol) of pyridinium chlorochromate in 2 mL of CH2Cl2 at room temperature. The solution was stirred overnight, filtered and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 6% EtOAc/hexane mixture as the eluent to provide 0.23 g (80%) of the titled compound as a clear oil: IR (neat) 3083, 2960, 2930, 2852, 2807 and 2709 cm−1; 1H-NMR (400 MHz, CDCl3) δ 0.04 (s, 6H), 0.99 (s, 6H), 1.23–1.29 (m, 2H), 1.40–1.48 (m, 2H), 3.47 (t, 2H, J = 6.8 Hz), 4.88 (dd, 1H, J = 4.8 and 1.2 Hz); 4.92 (q, 1H, J = 1.2 Hz) and 5.76 (dd, 1H, J = 17.6 and 10.4 Hz); 13C-NMR (100 MHz, CDCl3) δ −5.3, 18.3, 26.0, 26.7, 28.1, 38.6, 63.9, 110.3 and 148.4.

**Methyl 2-(6,6-dimethyl-3-oxo-oct-7-enyl)benzoate (24)**—To a solution containing 0.45 g (1.9 mmol) of the above diketo-ester 24 in 4 mL of CH2Cl2 was added a solution of 0.25 g (1.9 mmol) of the above aldehyde 23 in 4 mL of CH2Cl2 and the mixture was stirred at rt for 18 h. The solution was quenched with H2O and extracted with Et2O. The combined organic layer was dried over MgSO4 and the crude residue was purified by flash silica gel column chromatography using a 20% EtOAc/hexane mixture as the eluent to provide 1.0 g (20%) of the titled compound as a clear oil which exists primarily in the enol form: IR (neat) 3500, 1721, 1701, 1588 and 1265 cm−1; 1H-NMR (400 MHz, CDCl3) δ 1.02 (s, 6H), 1.62–1.70 (m, 2H), 2.28–2.35 (m, 2H), 3.83 (s, 3H), 4.90–5.00 (m, 2H), 5.75 (dd, 1H, J = 17.6 and 10.8 Hz), 7.47–7.53 (m, 3H) and 7.72–7.77 (m, 1H); 13C-NMR (100 MHz, CDCl3) δ 26.5, 33.9, 36.0, 39.8, 111.6, 147.0 and 202.8.

**Methyl 2-(2-diazo-6,6-dimethyl-3-oxooct-7-enyl)benzoate (25)**—To a solution containing 0.11 g (0.44 mmol) of p-nitrobenzenesufonyl azide in 3 mL of CH3CN at 0 °C was added 0.09 g (0.65 mmol) of Et3N. The reaction mixture was stirred for 3 h, the solvent was removed under reduced pressure and the crude residue was purified by flash silica gel column chromatography using a 50% EtOAc/hexane mixture as the eluent to provide 0.4 g (38%) of the titled compound as a clear oil: IR (neat) 3078, 2955, 2120, 1716, 1650 and 1280 cm−1; 1H-NMR (400 MHz, CDCl3) δ...
0.95 (s, 6H), 1.55–1.65 (m, 2H), 2.65 (brs, 2H), 3.85 (s, 3H), 4.87 (dd, 1H, J = 17.2 and 1.2 Hz), 5.69 (dd, 1H, J = 17.2 and 10.8 Hz), 7.33 (dd, 1H, J = 7.6 and 0.8 Hz), 7.53 (td, 1H, J = 8.0 and 0.8 Hz), 7.62 (td, 1H, J = 8.0 and 1.6 Hz) and 8.03 (dd, 1H, J = 7.6 and 0.8 Hz); 13C-NMR (100 MHz, CDCl3) δ 26.5, 36.0, 36.2, 36.9, 52.6, 86.1, 111.3, 126.4, 127.7, 130.1, 130.6, 133.0, 140.7, 147.2, 1658, 186.5 and 192.2.

1,1-Dimethyl-8-methoxy-12-oxa-tricyclo[6.3.1.0.140.7, 147.2, 165.8 and 192.2]octahydridibenzo[a,d]-4,11-dione (26)—To a solution containing 0.04 g (0.12 mmol) of diazo-dione 25 in 1 mL of benzene was added 0.004 g (0.01 mmol) of Rh2(OAc)4. The mixture was heated at 80 °C for 18 h, filtered and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 6% EtOAc/hexane mixture as the eluent to provide 0.012 g (92%) of the titled compound as a clear oil; IR (neat) 2955, 1721, 1552, 1455, 1396, 1285, 1120 and 1030 cm−1; 1H-NMR (400 MHz, CDCl3) δ 0.93 (s, 3H), 0.95 (s, 3H), 1.81 (ddd, 1H, J = 14.0, 9.2 and 1.6 Hz), 1.93 (dt, 1H, J = 14.0 and 9.6 Hz), 2.03–2.22 (m, 2H), 2.40 (t, 1H, J = 8.8 Hz), 2.65 (dt, 1H, J = 18.8 and 9.6 Hz), 2.81 (ddd, 1H, J = 19.2, 9.6 and 1.6 Hz), 3.49 (s, 3H), 7.48 (d, 2H, J = 7.6 Hz), 7.63 (td, 1H, J = 7.6 and 1.2 Hz) and 7.98 (dd, 1H, J = 8.4 and 1.2 Hz); 13C-NMR (100 MHz, CDCl3) δ 20.3, 29.8, 32.9, 35.7, 36.1, 36.5, 51.5, 52.7, 88.7, 106.5, 123.6, 127.5, 128.9, 129.6, 134.4, 144.6, 193.1 and 206.7; HRMS (FAB) Calcd for [C18H20O4]+: 300.1361. Found: 300.1373.

2-Isopropyl-1,3,4-trimethoxy-5-methyl-benzene (34)—To a solution of 1.2 g (5.7 mmol) sample of the penta-substituted arene 33 in 30 mL of THF at −78 °C was added 1.52 g (23 mmol) of NaH (60% in mineral oil) in one portion. The mixture was warmed to 0 °C and stirred for additional 2 h, and then quenched with H2O and extracted with Et2O. The combined organic layer was dried over Na2SO4 and the crude residue was purified by flash silica gel column chromatography using a 10% EtOAc/hexane mixture as the eluent to provide 1.15 g (90%) of the titled compound as a pale yellow solid: mp 26–27 °C; IR (neat) 1582, 1455, 1403, 1231, 1120 and 1030 cm−1; 1H-NMR (400 MHz, CDCl3) δ 1.32 (d, 6H, J = 7.2 Hz), 2.24 (s, 3H), 3.47 (sept, 1H, J = 7.2 Hz), 3.76 (s, 3H), 3.77 (s, 3H), 3.82 (s, 3H), 6.20 (s, 1H); 13C-NMR (100 MHz,CDCl3) δ 15.9, 21.3, 25.0, 55.6, 60.1, 60.9, 108.5, 127.9, 128.9, 145.5, 151.6, and 154.2; HRMS Calcld for [(C15H20O3)+]+: 225.1491. Found: 225.1487.

1-Bromo-3-isopropyl-2,4,5-trimethoxy-6-methylbenzene(35)—To a solution of 0.09 g (0.44 mmol) of the above penta-substituted arene 34 in 4 mL of THF at rt was added 0.02 g (0.44 mmol) of oxone®. The reaction mixture was allowed to stir at rt for 1 h. The mixture was then passed through a filter funnel and the filtrate was concentrated under reduced pressure. The crude residue was purified by flash silica gel column chromatography using a 10% EtOAc/hexane mixture as the eluent to provide 0.08 g (67%) of the titled compound as a yellow oil: mp 26–27 °C; IR (neat) 2935, 1454, 1398, 1231, 1120 and 1030 cm−1; 1H-NMR (400 MHz, CDCl3) δ 1.32 (d, 6H, J = 7.2 Hz), 2.30 (s, 3H), 3.43 (sept, 1H, J = 7.2 Hz), 3.72 (s, 3H), 3.73 (s, 3H), and 3.80 (s, 3H); 13C-NMR (100 MHz,CDCl3) δ 16.3, 22.1, 26.7, 60.1, 60.5, 61.4, 114.7, 130.5, 133.6, 148.5, 151.0, and 151.9.

2-Isopropyl-3,4-dimethoxy-4-[3-(tetrahydro-pyran-2-yloxy)-prop-1-ynyl]-cyclobut-2-enone (38)—To a solution of 0.25 mL (1.8 mmol) of 2-[(propyl-2-yn-1yl)oxy]-tetrahydrodropyrin in 3 mL of THF at −78 °C was added 0.84 mL (2.1 mmol) of n-BuLi (2.5 M in hexane) dropwise. The solution was stirred for 1 h at −78 °C and transferred to a −78 °C solution of 0.25 g (1.6 mmol) of 3-isopropyl-4-methoxy-cyclobut-3-ene-1,2-dione (31) in 3 mL of THF via cannula, followed by the addition of 0.24 mL (2.1 mmol) of MeOTf. The solution was warmed to 0 °C and was stirred for additional 30 min. After quenching with
aqueous NH₄Cl, the solution was extracted with Et₂O. The combined organic layer was dried over Na₂SO₄ and the solvent was removed under reduced pressure. The crude residue was purified by silica gel flash chromatography using a 10% EtOAc/hexane mixture as the eluent to provide 0.14 g (29%) of the titled compound as an orange oil: ¹H-NMR (400 MHz, CDCl₃) δ 1.07 (d, 6H, J = 7.2 Hz), 1.40–1.80 (m, 6H), 2.43 (sept, 1H, J = 7.2 Hz), 3.50 (s, 3H), 3.45–3.50 (m, 1H), 3.72–3.79 (m, 1H), 4.05 (s, 3H), 4.30 (dd, 2H, J = 3.0 and 1.2 Hz), and 4.72 (s, 1H, J = 2.0 Hz); ¹³C-NMR (100 MHz, CDCl₃) δ 18.8, 19.9, 23.9, 25.2, 30.0, 54.1, 54.2, 59.4, 61.8, 78.3, 87.6, 96.8, 135.6, 177.4 and 184.3.

(3-Isopropyl-2,4,5-trimethoxy-phenyl)-methanol (44)—To a solution of 4.0 g (13.8 mmol) of 1-bromo-3-isopropyl-2,4,5-trimethoxybenzene (43) in 55 mL of THF at −78 °C was added 6.1 mL (15.2 mmol) of n-BuLi (2.5 M in hexane) dropwise. The solution was stirred for 1 h, then 1.3 mL (17.3 mmol) of DMF was slowly added to the reaction flask. After stirring the mixture at −78 °C for 2 h, aqueous NH₄Cl was added. The mixture was extracted with EtOAc, dried over Na₂SO₄, and the solvent was removed under reduced pressure. The residue was then purified by flash silica gel chromatography using a 20% EtOAc/hexane mixture as the eluent to provide 2.9 g (87%) of 3-isopropyl-2,4,5-trimethoxybenzaldehyde as a white solid: mp 45–47 °C; IR (neat) 2955, 2842, 1685, 1583, and 1083 cm⁻¹; ¹H-NMR (100 MHz, CDCl₃) δ 3.91 (s, 3H), 7.22 (s, 1H), and 10.24 (s, 1H); ¹³C-NMR (100 MHz, CDCl₃) δ 21.6, 25.4, 55.8, 60.8, 65.4, 107.7, 124.4, 135.4, 150.0, 154.8, 156.8 and 189.1.

To a solution of 2.6 g (10.9 mmol) of the above aldehyde in MeOH at 0 °C was added 0.5 g (13 mmol) of NaBH₄ in portions. The mixture was stirred for 1 h at 0 °C, and then water was added. The MeOH was removed under reduced pressure and the residue was extracted with EtOAc. The combined organic layer was dried over Na₂SO₄ and the solvent was removed under reduced pressure. The crude residue was purified by flash silica gel chromatography using a 25% EtOAc/hexane mixture as the eluent to provide 2.9 g (87%) of 3-isopropyl-2,4,5-trimethoxybenzaldehyde as a white solid: mp 45–47 °C; IR (neat) 3416, 2955, 1598, 1480, 1224, 1107 and 1040 cm⁻¹; ¹H-NMR (100 MHz, CDCl₃) δ 1.07 (d, 6H, J = 6.0 Hz), 1.40–1.80 (m, 6H), 2.43 (sept, 1H, J = 6.0 Hz), 3.40 (sept, 1H, J = 6.0 Hz), 3.71 (s, 3H), 3.80 (s, 3H), 3.82 (s, 3H), 4.68 (d, 2H, J = 5.7 Hz), and 6.79 (s, 1H); ¹³C-NMR (100 MHz, CDCl₃) δ 21.6, 25.4, 55.8, 60.6, 65.4, 107.7, 124.4, 135.4, 150.0, 154.8, 156.8 and 189.1; HRMS Calcd for [C₁₃H₂₀O₄] + H⁺: 241.1440. Found: 241.1438.

2-(2,3-Dimethoxyphenyl)propan-2-ol (50)—To a solution of 9.3 g (47.5 mmol) of the above ester in 100 mL of THF at 0 °C was slowly added 50 mL (3.0 M) of methyl magnesium bromide. The solution was heated at reflux for 6 h. After cooling to 0 °C, the reaction mixture was quenched by the cautious addition of 50 mL of 1M HCl and was then extracted with ether. The organic phase was washed successively with water and brine, dried, filtered, and concentrated under reduced pressure. The residue was purified by flash silica gel chromatography using a 20% EtOAc/hexane mixture as the eluent to provide 8.75 g (94%) of the titled compound as a clear oil; ¹H-NMR (400 MHz, CDCl₃) δ 1.61 (s, 6H), 3.88 (s, 3H), 4.00 (s, 3H), 4.30 (s, 1H), 6.86 (dd, 1H, J = 8.0 and 2.0 Hz), 6.94 (dd, 1H, J = 8.0 and 2.0 Hz), and 10.02 (s, 1H, J = 8.0 Hz); ¹³C-NMR (100 MHz, CDCl₃) δ 31.0, 56.0, 61.2, 73.0, 111.8, 118.2, 123.9, 141.4, 147.0 and 152.9.
1-Isopropyl-2,3-dimethoxy-4-((methoxymethoxy) methyl)benzene (53)—To a solution of 2.2 g (10.1 mmol) of (4-isopropyl-2,3-dimethoxyphenyl)methanol in 50 mL of CH$_2$Cl$_2$ was added 5.3 mL (30 mmol) of Hünig’s base. To this mixture was slowly added 1.5 mL (20 mmol) of chloromethyl methyl ether at 0 °C and the reaction mixture was allowed to warm to room temperature and was stirred for 15 h. The reaction was then quenched by the addition of a saturated NH$_4$Cl solution and was extracted with CH$_2$Cl$_2$. The organic phase was washed with brine, dried over Na$_2$SO$_4$, filtered and concentrated under reduced pressure to afford a pale yellow residue. Purification by flash silica gel column chromatography using a 90% EtOAc/hexane mixture as the eluent afforded 1.3 g (90%) of the titled compound as a clear liquid: IR (thin film) 2961 cm$^{-1}$; $^1$H-NMR (400 MHz, CDCl$_3$) $\delta$ 1.22 (d, 6H, $J$ = 7.0 Hz), 3.33 (sept, 1H, $J$ = 7.0 Hz), 3.44 (s, 3H), 3.86 (s, 3H), 3.89 (s, 3H), 4.60 (s, 2H), 4.74 (s, 2H), 6.98 (d, 1H, $J$ = 8.0 Hz), and 7.09 (d, 1H, $J$ = 8.0 Hz); $^{13}$C-NMR (100 MHz) 23.7, 27.0, 55.5, 60.9, 61.0, 64.5, 96.0, 121.5, 125.0, 129.4, 143.2, 150.5 and 151.5; HRMS Calcd for [(C$_{14}$H$_{22}$O$_4$) + H$^+$]: 255.1596. Found: 255.1598.

1-Bromo-5-isopropyl-3,4-dimethoxy-2-((methoxymethoxy)methyl)benzene (54)—To a stirred solution of 0.5 g (2.0 mmol) of 1-isopropyl-2,3-dimethoxy-4-((methoxymethoxy) methyl)benzene (53) in 5 mL of DMF was added 0.35 g (2.0 mmol) of N-bromosuccinimide at room temperature. After stirring for 12 h at rt, the reaction mixture was quenched by the addition of NaHCO$_3$ and was extracted with Et$_2$O. The combined organic layer was washed with brine, dried over Na$_2$SO$_4$, filtered and concentrated under reduced pressure. The crude product was purified by flash silica gel column chromatography using a 66% CH$_2$Cl$_2$/hexane mixture as the eluent to afford 0.16 g (24%) of the titled compound as a clear oil; IR (thin film) 2962 cm$^{-1}$; $^1$H-NMR (600 MHz, CDCl$_3$) $\delta$ 1.29 (d, 6H, $J$ = 6.7 Hz), 3.28 (sept, 1H, $J$ = 6.7 Hz), 3.47 (s, 3H), 3.83 (s, 3H), 3.89 (s, 3H), 4.70 (s, 2H), 4.77 (s, 2H), and 7.21 (s, 1H); $^{13}$C-NMR (100 MHz, CDCl$_3$) $\delta$ 23.4, 27.1, 55.7, 60.8, 61.5, 64.3, 96.6, 120.0, 126.0, 129.1, 145.0, 150.2 and 153.4.
